

COMMITMENT TO SUSTAINABILITY

Dingle Distillery has introduced various environmental initiatives, allowing for a more sustainable distillation and production process for its Dingle Whiskey, Dingle Gin and Dingle Vodka.

The spent grain and pot ale (used for the production of its small batch whiskey) is reused as cattle feed by a local Dingle farm. This major step means the bulk of waste products from the Distillery's whiskey production are recycled back into the food chain.

Its use of a cooling tower drastically reduces the amount of water the distillery draws from its local water source. Heat exchangers, which both cool and heat the different liquids, further reduce the need for steam heat and boiler time. The distillery is also a verified member of Origin Green Ireland, a Bord Bia initiative enabling Ireland's food and drink industry to set and achieve sustainable food and drink production.
